

Claims

1-7 Canceled

8. (New) A control device comprising:

one or modules stored within a memory of the control device; and

an interface (8) for activating software modules or components of a software module by way of an external device (3), wherein the interface communicates with the one or more modules in a wireless manner by means of a telemetric device.

9. (New) The device according to claim 8, wherein transport of data during the telemetric transmission is protected by a safety device.

10. (New) The device according to claim 8, wherein additional hardware resources are connected to the control device in a telemetrically controlled manner.

11. (New) The device according to claim 8 further comprising:

an external device (3) in communication with the control device, the external device is connected to a transmitting and receiving unit by the interface.

12. (New) The device according to claim 11, wherein the control device is in a motor vehicle and the vehicle includes a transmitting and receiving unit which is connected to a network by the interface.

13. (New) The device according to claim 11, wherein the control device is in a motor vehicle and the vehicle includes a transmitting and receiving unit which is connected to a bus by the interface.

14. (New) A control device comprising:

one or modules stored within a memory of the control device; and

an interface extending software modules or components of a software module by way of an external device, wherein the interface communicates with the one or more modules in a wireless manner by means of a telemetric device.

15. (New) A control device comprising:

one or modules stored within a memory of the control device; and

an interface (8) for modifying software modules or components of a software module by way of an external device, wherein the interface communicates with the one or more modules in a wireless manner by means of a telemetric device.

16. (New) A method for activating software modules or components of a software module by means of a telemetric device, the method comprising:

providing one or modules stored within a memory of the control device;

providing an interface (8) for activating software modules or components of a software module by way of an external device (3), wherein the interface communicates with the one or more modules in a wireless manner by means of a telemetric device; and

activating the software modules or components of a software module by connecting an accessory unit in range of the external device.

17. (New) The method according to claim 16, wherein the accessory unit is a CD-ROM drive.

18. (New) The method according to claim 16, wherein the accessory unit is a diagnosis

AP 10811
test appliance.
